

Dmitrii Chichuk (@Jamminroot)

36 y/o

Not a big fan of pigeons

Skills

Languages: C# / .NET · Kotlin · TypeScript / Node.js · Python · C / C++

Backend: ASP.NET · gRPC / Protobuf · WebSockets · PostgreSQL · Redis · high-throughput billing & metering · real-time event processing

Infrastructure: Kubernetes · Docker · GitHub Actions · GitLab CI · release engineering · S3

Data & observability: ClickHouse · Grafana · metrics & alerting design · analytics pipelines

Mobile & desktop: Android (Kotlin) · accessibility services · desktop applications · UI automation

AI & automation: LLM integrations · AI assistants with knowledge bases · computer vision · n8n / workflow automation

Leadership: team leadership (14 engineers) · architecture & system design · code review · mentoring · UX direction

Recent activity (last 12 months)

Auto-generated weekly from GitHub commit history · updated 2026-07-03

I've been deep in Summit, a SaaS crypto algo trading platform with AI/neural-network integration — building out mobile responsive shells with Telegram miniapp support, implementing server-authoritative 2FA and session-inactivity locks, adding per-user follow capabilities with balance-relative sizing and order-type controls, enriching backtests with BTC market-regime context and funding-fee modeling, and introducing strategy-level comment fields and LLM token-cost estimates. On the embedded side, I've evolved the j-uni-hid firmware through multiple revisions (v9–v13) for ESP32-S3, adding features like dual-core support, BLE/USB hybrid operation, self-reporting stats, safe serial prints, and a matrix variant, while also building out the companion input-driver Windows WDK kernel driver with event filtering, block predicates, and integration-test coverage.

Alongside these core vectors, I ran a structured research campaign on crypto price-prediction models — over 300 experiments exploring sparse MoE gates, cross-pair features, snapshot ensembles, and temperature scaling to push past the 0.78 F1 ceiling. I built an Android TTS engine supporting multiple Russian voices with pitch control, Vosk/Silero endpointing, and RuNorm rule-based text normalisation. I also reworked the intag2 Windows file-tagging utility with CLI support, MS Store CI/CD pipelines, and Unicode metadata handling, and I overhauled the ozwil-android on-device LLM agent with sub-agent delegation strategies, KV-cache reuse, and model setup wizards. Smaller but notable efforts include a Neovim config migration to the 0.11 API, a YOLO labeler with batch mark mode, and a MynePro e-ink launcher with gesture navigation.

Activity timeline (last 12 months)

2026 Jul

Summit trading platform — 2FA, follows, backtests — summit

Built server-authoritative 2FA with session-inactivity lock, per-user follow capabilities with balance-relative sizing, backtest funding-fee modeling, BTC market-regime context, and strategy comment fields.

Summit — mobile shell and Telegram integration — summit

Implemented a responsive mobile shell with bottom nav and Telegram WebApp SDK, simplified the miniapp UI, and added auto card layout for dense data tables.

Freqtrade strategy variants — freqtrade_startegies

Added BTC-relative and pack-relative reversion strategies plus a broad EWO dip-buy variant across 50 pairs, all

with documented forward-test results.

2026 Jun

Summit — notifications, sidebar, engine polish — summit

Added rich Telegram trade notification cards, an auto-hide sidebar mode, color-coded backtest metrics, EWO-fidelity DSL infrastructure, and fixed the two-tier trailing stop and strategy editing bugs.

jolt — minimal AHK alternative — jolt

Built a scenario engine with typed actions, input gating, and Interception support; added conditions, stateless themes, and debug logging.

CV generator improvements — jamminroot

Refined the auto-CV pipeline: added dry-run preview, skills section, team/throughput metrics, and enforced consistent voice in LLM output.

2026 May

j-uni-hid firmware — v13 release — j-uni-hid

Released firmware v13 with fire-and-forget events, USB HID improvements, and an 8x8 matrix variant with PlatformIO build support.

input-driver — library and integration tests — input-driver

Added push-style event delivery with JidStartListener/JidStopListener, per-event block predicates, and a full integration-test runner covering all documented capabilities.

j-tts-android — engine overhaul — j-tts-android

Replaced multiple TTS engines: dropped Piper/eSpeak NG, added TeraTTS and sherpa-onnx Russian voices, F5-TTS scaffold, question/exclamation intonation sliders, and forced commercial-distribution-clean licensing.

intag2 — Unicode metadata fix — intag2

Fixed desktop.ini writing to UTF-16 LE for correct non-ASCII rendering in Explorer.

MEMU3 — YOLO inference and bow/flick work — MEMU3

Switched GPU inference from CUDA to DirectML, refactored YOLO class handling, and reworked the bow/flick system with bezier motion, user-input compensation, and closed-loop tracking.

CV generator — pulse charts and project cards — jamminroot

Added project cards with pulse-line charts to the README, smoothed Catmull-Rom curves, and improved heatmap rendering with empty-week slots.

2026 Apr

Summit — authentication and session security — summit

Implemented server-authoritative session inactivity lock with PIN/2FA/logout, fixed 2FA field name bug, and added admin reset of user stats.

j-uni-hid — v13 WIP and bugfixes — j-uni-hid

Drafted the v13s8x8 firmware variant and fixed a device disconnection issue in the earlier v13 build.

MEMU3 — aim assist and overlay refinement — MEMU3

Added HP-scaling aim, YOLO confidence threshold UI, debug overlay window, and runtime fallback from Interception to USB-HID.

papyrix — map app and knowledge base — papyrix

Added a full-map app with region selection and tile viewer, a knowledge base app with taxonomy browser, and optimised the map renderer for Apple Silicon.

2026 Mar

Summit — LLM token costs and backtest management — summit

Added per-signal LLM token/cost estimates, backtest run deletion and collapse of identical re-runs, and BTC market-regime context for quorum signals.

crypto-model-research — MoE experiments — crypto-model-research

Ran 300+ experiments on crypto price-prediction models, achieving a 0.7817 F1 with split MoE gates, snapshot ensembles, cross-pair BTC/ETH features, and temperature scaling.

ozwil-android — sub-agent architecture — ozwil-android

Rewrote the sub-agent delegation system with session-based routing, tool-call validation, setup wizard, KV-cache reuse, and persistent model keep-alive.

MEMU3 — status window and persistence — MEMU3

Rewrote the overlay with D3D11/D2D/DComp, added a status window, persisted mode and autofire state across restarts, and restricted aim assist to the focused window.

blackboard-launcher — gesture navigation — blackboard-launcher

Overhauled the backdrop with swipe page navigation, status bar control, and improved Onyx SDK drawing reliability.

2026 Feb

intag2 — CI/CD and MS Store pipeline — intag2

Built a robust MS Store submission pipeline with PowerShell REST API, split CI into discrete workflows, added changelog generation, and fixed folder property setting via CLI.

jaxon — code intelligence engine — jaxon

Added LSP integration, DI registration detection, dead-code analysis, and multi-language parsers (C++, Go, Rust, Svelte); shipped incremental sync and force-reindex flags.

n8n-nodes-telepilot-2 — auth fixes — n8n-nodes-telepilot-2

Fixed authentication race conditions, resolved CI test failures from n8n version bumps, and added an album trigger.

yolo-labeler — batch mark mode — yolo-labeler

Added multi-select mark mode for batch delete and label clearing, Ctrl+Delete deletion, and flexible yaml resolution.

.dotfiles — Neovim 0.11 migration — .dotfiles

Migrated LSP configuration to vim.lsp.config for Neovim 0.11, added OSC 52 clipboard support, and fixed treesitter parser installation.

2026 Jan

poker-cv — recovery and validation modules — poker-cv

Implemented generator-based hand recovery, CV pipeline with blinds/board-card detection, interpreter visualisation widget, and comprehensive codebase refactoring.

tasker — touch visualisation — tasker

Added touch event visualisation on sensor charts and improved UX with direct launch and completed status indicators.

2025

Summit — foundational platform build — summit

Built the core SaaS crypto algo trading platform with AI/NN twis, including engine infrastructure, strategy templates, and telegram bot integration.

j-uni-hid — firmware through v11 — j-uni-hid

Developed multiple firmware generations (v4–v11): dual-core support, BLE/USB touch, mouse emulation, self-reporting, safe serial, device profiles, and throttled power modes.

ozwil-android — initial LLM app scaffold — ozwil-android

Scaffolded the on-device LLM app with background service, tool-calling capability, and wake-word detection.

j-tts-android — early TTS work — j-tts-android

Began Android TTS implementation with Piper eSpeak NG, Vosk/Silero endpointing, and accent dictionaries.

auto-claude — multi-session AI coding — auto-claude

Built a multi-session AI coding assistant with git worktree management, squash merging, task-ID tracking, and Git rules configuration.

freqtrade-tg-multibot — Telegram monitoring — freqtrade-tg-multibot

Developed a Telegram bot for monitoring multiple Freqtrade instances, with daily profit calculation and authentication handling.

freqtrade_monitor — Flutter dashboard — freqtrade_monitor

Built a Flutter dashboard for Freqtrade with glassy cards, winrate bar charts, import-export settings, and dark UI.

2024

Summit — initial prototype — summit

Started the Summit crypto trading platform prototype, establishing the core architecture and telegram integration.

pAssistant — Telegram automation tooling — pAssistant

Built a Telegram automation tool with summarization, image duplicate detection, and multi-target message routing.

freqtrade_strats — strategy optimizations — freqtrade_strats

Optimised several Freqtrade trading strategies with custom indicators and leverage management.

Experience

Tech Lead

Sep 2024 – Present · 1 yr 10 mos

Deeplay · Full-time

- Lead a 14-person engineering team (7 developers, 2 reverse engineers, 2 L2 diagnostics experts, DevOps, 2 QA) building a real-time desktop application for intellectual/skill-based online games statistics and analytics; own architecture, roadmap, and the release pipeline shipping to 10+ target online platforms. Regularly drive cross-team efforts with analysts, technical writers, and project managers beyond my direct hierarchy.
- Led end-to-end development and launch of major product initiatives — a computer-vision pipeline, a desktop client, an agent/partner network, and several cloud-based services — owning architecture, core use scenarios, and UX direction. The desktop client drew 100+ organic access requests before any public announcement.
- Technically curated a series of product launches, each adding 5–30% to revenue.
- Single-handedly re-engineered the pricing mechanics of a billing system processing 0.5–1.5M operations per day; rolled it out to production with ~2 minutes of downtime and a seamless transition for clients.
- Shipped a customer-facing AI assistant backed by a curated knowledge base: account lifecycle, authentication, knowledge-base tooling, and failure alerting.
- Built the observability stack ingesting ~10M events/day: ClickHouse + Grafana metrics and alerting, messenger notifications, and internal diagnostic tools including screenshot-based remote debugging.
- Routinely build internal tooling that automates monotonous operational work — data converters with validation gates, log retrieval, admin UIs, and workflow integrations (n8n pipelines, custom hooks, Telegram/Mattermost clients).
- Primary quality gate for a codebase shipping ~50 PRs/month (250+ formal reviews on record); mentored 6 engineers end-to-end — several began onboarding newcomers themselves — before delegating day-to-day mentorship in 2025.
- Hands-on across the stack: C# / .NET backend, Kotlin Android companion app serving up to 2.5k DAU (including an accessibility-based input automation engine), CI/CD, dynamic server configuration.

Lead .NET Developer

Oct 2023 – Aug 2024 · 10 mos

Deeplay · Full-time

- Owned end-to-end backend feature delivery (C# / .NET); drove cross-component design decisions and stability work.
- Led a platform-wide migration of 10+ production integrations onto a new shared core in a single coordinated sweep.
- Owned release engineering for a 13-service fleet on Kubernetes — 350+ versioned production releases shipped over my tenure — including capacity management and credential/endpoint migrations across two product lines.
- Extended protocol-level integrations with new session modes, event types, and dynamic pricing flows.
- Standardised internal tooling and authored team-wide operational runbooks; mentored junior engineers.
- Continued maintenance of the Android companion app (Kotlin) and internal annotation frameworks.

Senior .NET Developer

Jun 2021 – Sep 2023 · 2 yrs 3 mos

Deeplay · Full-time

- Shipped backend features (C# / .NET) for a real-time desktop application for intellectual/skill-based online games statistics and analytics, supporting 10+ target online platforms.
- Engineered protocol-level platform integrations: transformed captured, decoded network traffic into consistent real-time session state with reconnect, recovery, and catch-up handling; took three integrations from empty repository to production, the largest — including a full secondary real-time subsystem — in ~6 months.
- Rolled out a shared rules-based classification engine across the entire integration fleet.
- Acted as de-facto release manager: coordinated hundreds of staged rollouts across test/stage/production environments on Kubernetes.

- Built and maintained the companion Android app (Kotlin): telemetry, CI/CD, dynamic server configuration, in-app updates.
- Authored internal frameworks including an image/video annotation tool for scaled rectangle previews — adopted across the team.
- Mentored junior engineers and wrote team onboarding documentation: workspace setup, conventions, operational runbooks.

Software Development Engineer

Akvelon (vendor for Microsoft) · Full-time

Mar 2019 – Oct 2021 · 2 yrs 7 mos
Ivanovo, Russia

- Developer in the Microsoft App Center SDK team
- Worked on .NET, Android, Apple, Cordova, Xamarin and React Native App Center SDKs

Developer

ICVR · Full-time

Sep 2018 – Feb 2019 · 5 mos
United States (remote)

- Built JetSetTV, an Android TV application, from scratch in a couple of months
- Worked on bug fixes and new features in Unity
- Set up CI/CD with Unity Cloud Build + GitLab
- Built a barebones REST API with ASP.NET

Full-stack Android developer

Konstanta, LLC · Full-time

Jan 2016 – Apr 2018 · 2 yrs 3 mos
Arkhangelsk, Russia

- Designed and built Android applications for clients across multiple verticals
- Worked with cross-functional teams; integrated third-party APIs; wrote unit tests
- Developed and deployed several b2b systems on 1C:Enterprise
- Built software for tracking Parkinson's disease patients (prescriptions, treatments, signs, test results) on 1C:Enterprise

Full-stack ERP developer

Konstanta, LLC · Full-time

Aug 2012 – Jan 2016 · 3 yrs 5 mos
Arkhangelsk, Russia

- Specified, customized and tested 1C ERP/CRM features for end users
- Authored help documentation; defined ERP design and coding standards
- Worked with end users to translate business processes into technical solutions

Selected projects

summit · C#

SaaS crypto algorithmic trading platform with AI and neural network components.

j-uni-hid · C++

Feature-rich mouse and keyboard emulation firmware for ESP32-S3.

input-driver · C

Windows input filter and injection driver similar to Interception.

crypto-model-research · Python

R&D project for crypto price prediction models.

poker-cv · Python

Computer vision experiments for online poker platforms.

intag2 · C++

Assign tags to files and folders in Windows Explorer.

j-tts-android · Kotlin

Android TTS engine using Silero and phonetizers.

ozwil-android · Kotlin

LLM-powered Android assistant with phone control capabilities.

freqtrade-tg-multibot · C#

Multi-bot Telegram interface for Freqtrade with web dashboard.

jamminroot · TypeScript

A personal CV generator using LLMs to analyze work history and produce PDFs.
